

LAB EXPERIMENT RECORD

03-10-2026---Set 8: Employee Performance Analysis

Department	AIML
Course Code / Course Name	DSA0601 / Data Handling and Visualization
Experiment	Data Visualization using R and Tableau
Name	HYDERABAD MOHAMMED NAWAZ
Register Number	192325060
Date	03 OCTOBER 2026
Day	Saturday

Aim

To analyze employee performance data using a line chart, bar chart and table, and to build an interactive Tableau dashboard for exploring employee performance.

Dataset: Employee Performance

Employee ID	Department	Years of Service	Performance Score
1	Sales	5	85
2	HR	3	92
3	Marketing	7	78

Question 1: Line Chart of Performance Trend

Question: Create a line chart to visualize the performance trend of employees over time. Label the axes and title the chart.

Aim: To visualize the performance trend of employees using a line chart with labelled axes and a title.

Result: Performance rises from 85 for Employee 1 to a peak of 92 for Employee 2, then falls to the lowest value of 78 for Employee 3.

Question 2: Bar Chart of Employees by Department

Question: Generate a bar chart showing the distribution of employees across different departments. Label the chart elements.

Aim: To show the distribution of employees across departments using a labelled bar chart.

Result: Sales, HR and Marketing each have exactly 1 employee, so the three bars are equal in height.

Question 3: Table of Employee Performance

Question: Build a table to display the performance data for each employee. Label the table elements.

Aim: To present the department, years of service and performance score of each employee in a labelled table.

The screenshot shows the RStudio interface. The script editor on the left contains the following R code:

```
1 employee_data <- data.frame(
2   Employee_ID = c(1, 2, 3),
3   Department = c("Sales", "HR", "Marketing"),
4   Years_of_Service = c(5, 3, 7),
5   Performance_Score = c(85, 92, 78)
6 )
7
8 print(employee_data)
```

The console on the right shows the output of the code:

```
R - R 4.4.2 - ~/
Employee_ID Department Years_of_Service Performance_Score
1          1      Sales              5              85
2          2        HR              3              92
3          3   Marketing              7              78
> employee_data <- data.frame(
+   Employee_ID = c(1, 2, 3),
+   Department = c("Sales", "HR", "Marketing"),
+   Years_of_Service = c(5, 3, 7),
+   Performance_Score = c(85, 92, 78)
+ )
>
> print(employee_data)
Employee_ID Department Years_of_Service Performance_Score
1          1      Sales              5              85
2          2        HR              3              92
3          3   Marketing              7              78
> |
```

Result: The table lists all three employees; the HR employee has the highest score (92), and the Marketing employee, with the most service (7 years), has the lowest (78).

Question 4: Interactive Tableau Dashboard

Question: Develop a Tableau dashboard combining the line chart, bar chart, and the table for interactive exploration of employee performance data.

Aim: To build an interactive Tableau dashboard that combines the line chart, bar chart and table for exploring employee performance.

Result: The dashboard places all three views together, and a department filter updates them so users can explore performance interactively.

Overall Result

Observation: The average performance score is 85, and a longer service period does not guarantee a higher score in this small sample.
